

Informații legate de ventilație, plită electrică cu inducție SDK 52 Domino

The hob can, without any problems, be built-in into any cabinet modules with drawers (fig. 1), oven (with ventilation) or similar appliance (fig. 2).

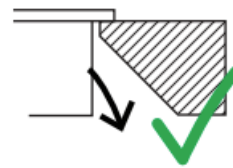

All you have to make sure is, that there is free access for the air intake/outlet and that there is enough ventilation in the cabinet below the hob.

The cross member in the top of the cabinet should be removed so good ventilation is present.

See below:

If the tabletop thickness is e.g. 30 mm, must the front edge be removed where the air intake/outlet is. It must not be blocked.

If the tabletop thickness is above 30 mm, must a bevel cut be made in the front edge where the air intake/outlet. It must not be blocked.
